## 1. Descriptive Statistics

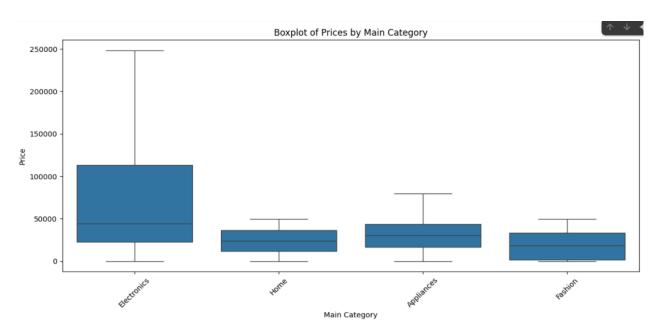

Descriptive statistics summarize and describe the main features of a dataset. They provide a snapshot of the data without drawing inferences about a larger population

### **CONCLUSION:**

#### **Correlation:**

- Available Stock and Total Sold have a positive correlation, indicating a relationship between these two variables.
- The correlation heatmap provides a summary of how variables relate to each other in the dataset.

#### **Feature Distributions:**

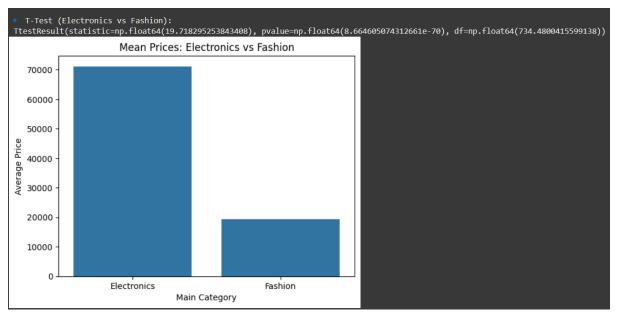

- Price, Number of Buyers, and Total Sold are right-skewed, showing that most values are on the lower end with fewer high values.
- Rating is left-skewed, indicating that most items have higher ratings.

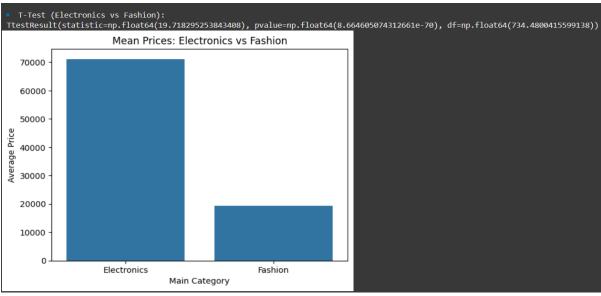

#### **Category Price Comparison:**

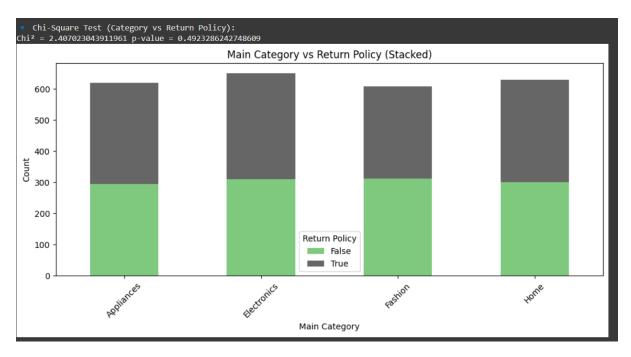

- The boxplot visually displays the differences in price ranges and medians across different product categories.
- The mean price bar chart provides a direct comparison of average prices for Electronics and Fash

#### 2. Inferential Statistics

Inferential statistics are used to draw conclusions and make predictions about a population based on a sample of data. They help us generalize findings beyond the specific dataset.

#### **CONCLUSION:**

#### T-test Result:

- The T-test provides statistical evidence that the average prices of Electronics and Fashion are significantly different.
- This inference allows us to generalize that, in the larger population, Electronics items likely cost more than Fashion items.

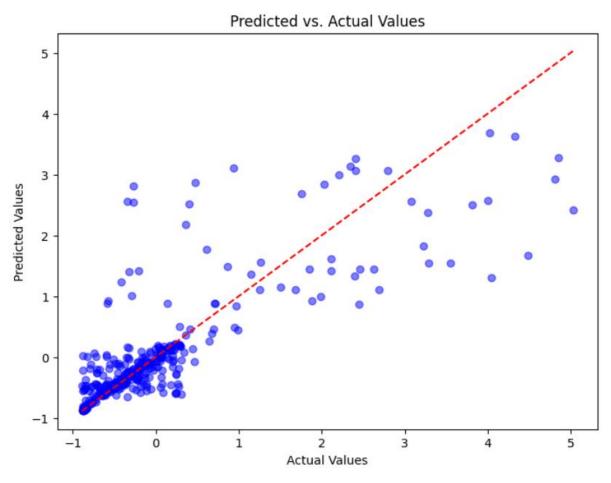

#### **Average Price Interval:**

- The confidence interval estimates a range where the true average price of *all* items is likely to fall, not just those in the sample.
- This allows us to make a probabilistic statement about the population mean.

#### Category vs. Return Policy:

- The Chi-Square test helps us infer whether there's a relationship between product category and return policy across the entire population of items.
- The conclusion that there's no significant association is an inference about the broader population.

#### 3. Machine Learning Program

#### **CONCLUSION:**

- 1. **Moderate Accuracy**: The model shows moderate predictive accuracy for product prices, explaining ~66% of the variance (R-squared of 0.6648).
- 2. **Potential Overfitting**: There's a possibility of overfitting, as the model performs better on validation data than on unseen test data.
- 3. **Room for Refinement**: Further analysis and optimization are needed to improve accuracy and generalization ability for real-world scenarios.
